Portfolio: Writing samples | Research papers

PROFILE

Writer and ML researcher who can build long-form fictional worlds and explain complex technical work in plain language. Drafting an 8-book saga (228 chapters drafted), with five stories published on Wattpad and short-form writing in English, Hindi and Hinglish. Research in reinforcement learning, quantum computing and causal ML, documented in public repositories with full write-ups.

FICTION & CREATIVE WRITING

- **Queen (with Curse)** – an 8-book found-family saga following a group of friends from school to adulthood. Three volumes drafted (228 chapters); remaining volumes outlined. Maintains plot, character-arc and worldbuilding continuity across a multi-book structure.
- **Five stories published on Wattpad** (88 chapters): *Loving You Is a Losing Game* (fantasy romance), *When the Star Misread the Moonlight* (slow-burn), *98.2 & 99.4* (friendship), *Do Akshar* (tragedy) and *Be Alive* (military romance).
- **Story copy:** wrote the blurbs, taglines and character introductions for a seven-story collection, in back-cover style.
- **Short-form writing in English, Hindi and Hinglish:** poetry, letters and reflections, including a persuasive piece on Karna and Arjuna's choices (*Dharma ka Marg*) and a wedding-vow dialogue (*The Promise*).

TECHNICAL WRITING & RESEARCH

- **Four research papers written** on RLHIL, Noise-Optimal Grover, CALF and QuLit & HERMES (linked under Portfolio), each documenting the problem, method, experiments and results.
- **RLHIL – Learning When to Intervene:** reinforcement-learning (PPO) framework that decides when a human should step into an AI pipeline. 200+ experiments; validated with no retraining on four external datasets (fraud, heart disease, diabetes, bank marketing); adapts to an unseen pipeline within five gradient updates; keeps 92%+ of performance under adversarial perturbation. Wrote the full README, methodology and statistical validation.
- **Noise-Optimal Grover:** derived a formal noise-optimality theorem for how many Grover iterations are best on noisy quantum hardware; introduced Grover Noise Fingerprinting and the Grover Fidelity Score; validated on real IBM Quantum hardware.
- **CALF-Insurance:** tree-structured, cross-attention causal AI architecture for Individual Treatment Effect estimation, extended into an agentic insurance-underwriting pipeline with governance, audit trail and automated document generation.
- **QuLit & HERMES:** quantum-linguistic framework for literary interpretation across 6 languages, combining NLP and quantum computing. **SOLAR:** seven-agent ensemble for misinformation detection, combining classical ML and LLM reasoning.

EXPERIENCE

Data Engineering Intern – Intarinz *May 2024 – July 2024*

- Built end-to-end AWS data pipelines (S3, Glue, Lambda, Redshift) for enterprise data ingestion.
- Documented transformation, validation and lineage processes to support monitoring and team handover.

EDUCATION

B.Tech, Computer Science and Engineering – National Institute of Technology, Warangal *2022 – 2026*

SKILLS

Writing: long-form fiction, worldbuilding, dialogue, blurb and back-cover copy, self-editing and revision, bilingual writing (English, Hindi/Hinglish), explaining technical material for general readers.

Technical: Python, PyTorch, TensorFlow, HuggingFace Transformers, Scikit-learn, Qiskit, PennyLane, SQL, C++, Java, AWS, Kafka, Streamlit.
